I'm a beginner to mysql and I have two tables: Schema1 artist | song artist_id artist_name And Schema2 song | genre song_id song_title genre_id As you can see, there is a relationship between the two tables (Schema1.artist.song has a foreign key pointing to Schema2.song and Schema2.song has a foreign key pointing to Schema1.artist). I'm working on a query to fetch the song titles of an artist. Here are the steps I have taken: SELECT songs.song_title, genres.genre_name FROM Schema2.song JOIN genres ON genres.genre_id = song.genre_id JOIN Schema1.artist ON song.artist_id = artist.artist_id JOIN Schema1.artist AS artist_search WHERE artist_search.artist_name LIKE '%\$artist_search_name%' ORDER BY songs.song_title ASC So I was wondering if a database is smart enough to know which artist should I join? I would need to join Schema1.artist every time I fetch the data. Is there a better way? I need to fetch all the songs of an artist as it is their most searched artist.
