The present invention relates to a data reproduction method of a disc recording medium, for reproduction in which from data recorded on the disc recording medium, data previously recorded on an area of the disc recording medium are reproduced and reproduced data recorded on a target area are reproduced. Discs on which video, audio and other information is recorded are known as optical discs. According to the specifications of BD-ROM (Blu-ray Disc-Read Only Memory), the storage capacity of one BD-ROM is 27 gigabytes, and the storage capacity of one BD-R (rewritable) is about 23 gigabytes. BD-R can be rewritten approximately 1,000,000 times. Therefore, BD-R is suitable for recording content in which copyright information is important, for example, movie content, or broadcasting content. BD-R uses the blue-violet laser with a wavelength of 405 nm to record data, and the record capacity of the optical disc is 22 gigabytes. According to the specifications of BD-R, from data recorded on the disc, data recorded on an area of the disc in the vicinity of a target area are reproduced first, and the target area is then reproduced. The specification of BD-ROM states that, for the purpose of data reproduction from a target area, data are reproduced on a scanning line basis from the start of the target area. Therefore, in data reproduction from a target area, the first data on the scanning line are reproduced, after which, if data cannot be reproduced from that area, data on the next scanning line are reproduced. The specification of BD-R states that the data reproduction timing is the time at which data are reproduced from the start of the target area. Therefore, in data reproduction from a target area, if data cannot be reproduced from a certain area, data are reproduced from an adjacent area. However, when the above-mentioned data reproduction method is applied to a disc recording medium on which data are recorded in a spiral pattern, a problem occurs in that the reproduction of the data recorded on the disc recording medium is delayed. When reading out data, the data reproduction timing is determined on a scanning line basis, and the direction of data reproduction is set on a track basis. However, when reading out data recorded on a disc recording medium which is spirally recorded, the reproduction 2d92ce491b
