The QNX Momentics IDE is an integrated development environment that provides a wide selection of tools and libraries to help you create professional grade code. The linker is a cross-platform debugging and linking tool that supports the creation and execution of native applications. The compiler is a cross-platform code generator that lets you target the device or simulator without having to create a BlackBerry 10 Native Bundle. Native build libraries help you easily create libraries of native functions that can be used in your applications. Package and upload your applications using the command line tools and build definitions. A: Firstly, Use BlackBerry C/C++ or Java. To compile your source code, use `bbcc` or `javac` respectively. Now, Write an application to test. To compile it for device use the following `javac -m "device" -cp /path/to/bbc.jar: -d. YourApp.java` or `javac -m "device" -cp /path/to/bbc.jar: -d.` And then execute `java -Dnative.code=true YourApp` A: The accepted answer is no longer valid. The BlackBerry 10 Native SDK has developed tools for developing BlackBerry 10 native applications. These tools include: QNX Momentics IDE Linker Compiler Libraries Command-line tools The BlackBerry 10 Native SDK includes the same libraries as the BlackBerry 10 Native SDK and the linking tools which are necessary for compiling your native applications. This includes LLDB on iOS. Because the resources, especially the LLDB debugger, are only available on devices, you don't need to include them in your app but will have to build them separately and explicitly include them into your app by hand. Use the code: Compile your app with this command line: `bcompile` or use the project generation tool in the BlackBerry 10 Native SDK. This will create your app's BAN, runnable as a native application, in the output directory. I use QNX Momentics IDE with the BlackBerry 10 Native SDK and it provides excellent support for Qt (if you use that). Solomon

This native SDK lets you create QNX Native Packages, and these packages will be available for easy installation on a BlackBerry 10 device. You'll find that the BlackBerry native SDK lets you create two types of application. The first is a standard application. The second is a Content Application. A typical BlackBerry 10 standard application is an application that works the same way that it does on BlackBerry devices. The Content Application, on the other hand, is a different type of application that allows you to build a content application. A content application is only relevant in the case of a web browser application. The standard application is used to communicate with other applications on the BlackBerry 10 OS and makes it possible to integrate more content than the device allows. For instance, there is a standard application, which means there is an application that connects to other applications on the OS. If you want to create a toolbar for example, it is possible. You would not have to create a custom toolbar, or buttons and if you do, they would be listed in the toolbar of a B10 device. It is possible to create content applications, and they show up in the BlackBerry Playbook Manager.
