KeyMacro is a utility program that works similar to the common text replacement keyboard macros on PC. A program user can manually create a list of key sequences that can be run with just one click in their respective hotkey. how do i activate my celeron2 processor? i need to know so i can upgrade it because my bios doesn't support it. it says its at 1.5 ghz but mine's a 2 ghz so can u help me. how do i activate my celeron2 processor? i need to know so i can upgrade it because my bios doesn't support it. it says its at 1.5 ghz but mine's a 2 ghz so can u help me. Best answer: I know little about the Celeron2, but by guessing your motherboard is an older type and you can't upgrade it to the Celeron2. Basically your CPU is useless as it is, unless it can run a Celeron2 and you have the motherboard to support it. To get a Celeron2 will require a replacement motherboard and a replacement CPU. Trying to activate any CPU would only increase the heat output when the CPU is running, as it's not designed to overclock to the speed it is running at. The Celeron 2 is specifically designed to not overclock. I would suggest buying a new motherboard and processor, as you don't want to overheat your CPU, as it can cause permanent damage. i am running a celeron 2 1.75 ghz, if i put in a 2.0 ghz will it damage my motherboard, it says mine is at 1.5ghz but on the cpu part it says 2.0 ghz? help Best answer: I know little about the Celeron2, but by guessing your motherboard is an older type and you can't upgrade it to the Celeron2.
